# How you like DEM apples 

EGEE 520

By: Abby Kenigsberg<br>Ben Madara

## What is DEM

- Discrete Element Method
- Particle Based
- Explicit Time Steps
- Useful for:
- Modeling Movement of Individual Particles
- Rotation of Particles
- Time Steps
- Progressive Failure
- Not Useful for:
- Complex Particle Geometries and Arrangements
- Roughness, Texture
- Grain Crushing, Particle Breakage
- Non-Idealized Contacts

## Historical perspective

- First developed by Cundall in his 1971 thesis- "A computer model for simulating progressive largescale movements in blocky rock systems"
- Modeled the movement of particles as a collapse of cylinders and toppling of blocks
- Modified into a RBM (restricted Boltzmann machines) code (Cundall 1974), FORTRAN code (Cundall 1978), and a 3D model including fluid and pore pressure (Cundall and Hart 1985)
- Current Uses:

- Agriculture
- Food Transport
- Pharmaceutical
- Civil Engineering
- Powder Metallurgy
- Chemical Engineering

## General Principles

- Newton's Second Law of Motion
- Force Displacement Law

> Force Displacement Laws (e.g. stiffness, friction)

Force Boundary
Conditions

## Governing Equations

- DEM uses two types of governing laws:
- Force-Displacement Law
- Hooke's law, friction etc...
- Newton's Second Law of Motion

- $\mathrm{F}=\mathrm{MA}$
- Time Step
- Discrete
- Critical Time Step

## DEM Process Flow

## Hand Calculation

Time Step
$\Delta \mathrm{T}=\sqrt{ }(\mathrm{M} / \mathrm{K})$

Forces on Grains
$\Delta \mathrm{F}_{\mathrm{n}}=\mathrm{K}_{\mathrm{n}}(\Delta \mathrm{n})_{\mathrm{t} 1}=\mathrm{K}_{\mathrm{n}}(\mathrm{V})(\Delta \mathrm{t})$

Newton's Second Law
$\mathrm{F}=\mathrm{ma}$
$\ddot{X}=F_{(x)} / m$

Integrate to find velocity
$\dot{X}_{\mathrm{t} 2}=\left(\mathrm{F}_{\mathrm{x}} / \mathrm{m}\right) \Delta \mathrm{t}$

Integrate again to find relative displacements

$$
\begin{aligned}
& \left(\Delta \mathrm{n}_{(\mathrm{A})}\right)_{\mathrm{t} 2}=\left(\mathrm{v}-\left[\mathrm{F}_{(\mathrm{x})} / \mathrm{m}\right] \Delta \mathrm{t}\right) \Delta \mathrm{t} \\
& \left(\Delta \mathrm{n}_{(\mathrm{B})}\right)_{\mathrm{t} 2}=\left(\left[\mathrm{F}_{(\mathrm{x})} / \mathrm{m}_{(\mathrm{x})}\right] \Delta \mathrm{t}-\left[\mathrm{F}_{(\mathrm{y})} / \mathrm{m}_{(\mathrm{y})}\right] \Delta \mathrm{t}\right) \Delta \mathrm{t} \\
& \left(\Delta \mathrm{n}_{(\mathrm{C})}\right)_{\mathrm{t} 2}=([\mathrm{F}(\mathrm{y}) / \mathrm{m}(\mathrm{y})] \Delta \mathrm{t}-[-\mathrm{v}]) \Delta \mathrm{t}
\end{aligned}
$$

## Pennstate Realistic Grain Orientation

Unit Vector-Normal Direction
$e_{i}=\left(y_{i}-x_{i}\right) / D=(\cos \alpha, \sin \alpha)$
Shear Direction
$\mathrm{t}_{\mathrm{i}}=\left(\mathrm{e}_{2},-\mathrm{e}_{1}\right)$

Velocity:
$\dot{X}_{i}=\left(\dot{x}_{i}-\dot{y}_{\mathrm{i}}\right)-\left(\dot{\theta}_{(\mathrm{x})} \mathrm{R}_{(\mathrm{x})}+\theta_{(\mathrm{y})} \mathrm{R}_{(\mathrm{y})}\right) \mathrm{t}_{\mathrm{i}}$

Velocity Components:

$$
\begin{aligned}
& \dot{n}=\dot{X}_{i} e_{i}=\left(\dot{x}_{i}-\dot{y}_{\mathrm{i}}\right) \mathrm{e}_{\mathrm{i}}-\left(\dot{\theta}_{(x)} \mathrm{R}_{(\mathrm{x})}+\dot{\theta}_{(\mathrm{y})} \mathrm{R}_{(\mathrm{y})}\right) t_{\mathrm{i}} \\
& \dot{\mathrm{~s}}=\dot{X}_{\mathrm{i}} \mathrm{t}_{\mathrm{i}}=\left(\dot{x}_{\mathrm{i}}-\dot{y}_{\mathrm{i}}\right) \mathrm{t}_{\mathrm{i}}-\left(\dot{\theta}_{(\mathrm{x})} \mathrm{R}_{(\mathrm{x})}+\dot{\theta}_{(\mathrm{y})} \mathrm{R}_{(\mathrm{y})}\right) \mathrm{t}_{\mathrm{i}} \mathrm{t}_{\mathrm{i}}
\end{aligned}
$$

## Putting it all Together

Force-Displacement
$\Delta \mathrm{F}_{\mathrm{n}}=\mathrm{K}_{\mathrm{n}}(\Delta \mathrm{n})_{\mathrm{t} 1}$
$=\mathrm{K}_{\mathrm{n}}(\mathrm{V})(\Delta \mathrm{t})$
$=\mathrm{K}_{\mathrm{n}}\left[\left(\dot{\mathrm{x}}_{\mathrm{i}}-\dot{\mathrm{y}}_{\mathrm{i}}\right) \mathrm{e}_{\mathrm{i}}\right] \Delta \mathrm{t}$
$\Delta \mathrm{F}_{\mathrm{s}}=\mathrm{K}_{\mathrm{s}}\left[\left(\dot{\mathrm{x}}_{\mathrm{i}}-\dot{\mathrm{y}}_{\mathrm{i}}\right) \mathrm{t}_{\mathrm{i}}-\left(\dot{\theta}_{(\mathrm{x})} \mathrm{R}_{(\mathrm{x})}+\dot{\theta}_{(\mathrm{y})} \mathrm{R}_{(\mathrm{y})}\right) \Delta \mathrm{t}\right.$

Force Increment Sum
$\left(\mathrm{F}_{\mathrm{n}}\right)_{\mathrm{N}}=\left(\mathrm{F}_{\mathrm{n}}\right)_{\mathrm{N}-1}+\Delta \mathrm{F}_{\mathrm{n}} ;\left(\mathrm{F}_{\mathrm{s}}\right)_{\mathrm{N}}=\left(\mathrm{F}_{\mathrm{s}}\right)_{\mathrm{N}-1}+\Delta \mathrm{F}_{\mathrm{s}}$

## Failure

$\left(\mathrm{F}_{\mathrm{s}}\right)_{\max }=\mathrm{F}_{\mathrm{n}} \tan \Phi_{\mu}+\mathrm{c}$
Damping-Contact
$\mathrm{C}_{\mathrm{n}}=\beta \mathrm{K}_{\mathrm{n}} ; \mathrm{C}_{\mathrm{s}}=\beta \mathrm{K}_{\mathrm{s}}$
Damping-Global
$\mathrm{C}=\alpha \mathrm{m}_{(\mathrm{x})} ; \mathrm{C}^{*}=\alpha \mathrm{I}_{(\mathrm{x})}$

## Numerical Model

## Input:

- Stiffness:
- K=0.002N/m
- Mass
- $1.5 \mathrm{e}-5 \mathrm{~kg}$
- Time Step
- 0.08s
- Velocity-initial
- $1 \mathrm{e}-5 \mathrm{~m} / \mathrm{s}$
- Radius
- 0.001 m

Output:

| Time $(\mathbf{s})$ | Displacement $(\mathbf{m})$ | Velocity $(\mathbf{m} / \mathbf{s})$ | Acceleration $\left(\mathbf{m} / \mathbf{s}^{\mathbf{2}}\right)$ |
| :---: | :---: | :---: | :---: |
| 0.1732 | $-5.20 \mathrm{E}-06$ | $4.00 \mathrm{E}-05$ | $2.31 \mathrm{E}-04$ |
| 15.0688 | -4.5621 | 0.3028 | 0.0201 |
| 29.7047 | -34.947 | 1.1765 | 0.0396 |

## Other Approaches

- Varying Contact Types
- Utilize Thousands of Grains
- Propagation and Mechanics of Fractures

Table 8.2 Types of contacts for 2D polygons and 3D polyhedral blocks

| Block shape | Contact type |
| :--- | :--- |
| General 2D polygons (convex or concave, singly | Vertex-to-vertex |
| or multiply connected) | Vertex-to-edge |
|  | Edge-to-edge |
| Convex 3D polyhedra | Vertex-to-vertex |
|  | Vertex-to-edge |
|  | Vertex-to-face |
|  | Edge-to-edge |
|  | Edge-to-face |
|  | Face-to-face |

## ESyS-Particle

## Input Parameters

## Wet Particles

## Dry Particles

| General Properties | A |
| :--- | :---: |
| Particle-Particle Friction Coefficient(0-1) | 0.85 |
| Particle-Boundary Friction Coefficient (0-1) | 0.75 |
| Coefficient of Restitution (0.075-1) | 0.100 |
| Rotational Damping(0-10) | 1.00 |
| Ratchet Effect | YES |
| Use Ratchet Effect | 0.150 |
| Particle-Particle Cohesion Factor(0-0.25) | 0.150 |
| Particle-Boundary Cohesion Factor(0-0.25) |  |
| Liquid Bridge | YES |
| Use Liquid Bridge | 0.50 |
| Surface Tensions (0.05 -0.50 J/m²) | 15.0 |
| Water Content (\%) | 2.00 |
| Boundary Surface Tension Multiplier(0-10) | 15.00 |
| Equivalent Sphere Size Ratio |  |

| General Properties | A |
| :--- | :---: |
| Particle-Particle Friction Coefficient(0-1) | 0.30 |
| Particle-Boundary Friction Coefficient(0-1) | 0.20 |
| Coefficient of Restitution (0.075-1) | 0.150 |
| Rotational Damping (0-10) | 2.00 |
| Ratchet Effect | NO |
| Use Ratchet Effect |  |
| Particle-Particle Cohesion Factor(0-0.25) |  |
| Particle-Boundary Cohesion Factor(0-0.25) |  |
| Liquid Bridge | NO |
| Use Liquid Bridge |  |
| Surface Tensions (0.05-0.50 $\mathbf{~ J / m}$ |  |
| Water Content $\%$ ) |  |
| Boundary Surface Tension Multiplier(0-10) |  |
| EquivalentSphere Size Ratio |  |

## Animation Results

Dry particles on 20 个o decline
Wet particles on 20 个o decline

## Animation Results

Dry particles on 30 个o decline
Wet particles on 30 个o decline

PennState
Example Animations

L-shaped box and Funnel

Bruising on Pears

Fault Motion
