

# Cascaded Hydropower

---

A Beckman presentation

# Hydropower in the U.S.

# History

- Started early 1880's to provide lighting
- First AC power plant 1893 in California
- 1920s Army Corps core of engineers starts building plants
- 1933 Tennessee Valley Authority (TVA) established
  - Great Depression
  - Government infrastructure economic stimulus
- 1936 Hoover dam project

# Today

---

- TVA operates 29 dams on one river system
- In total US gets 6.3% of electricity from hydropower
- 2021 net summer capacity about 80 GW
- Many dams in the US are for purposes other than electricity (flood control)

# Major and notable Rivers

---

Colorado River: Hoover dam (2GW) , Glen canyons dam, etc

Columbia River: Grand Coulee dam (6.8GW)and Chief Joseph dam (2.6GW)

Tennessee River: Kentucky dam 223 MW

# History

---

- First industrial plant built 1885 for a mine
- First hydro power station (Okere Falls) built near Rotorua 1901
- Hydro schemes built as early as 1903 (Waipori) and 1914 (Coleridge station)
- Waikato River Cascade built between 1953 and 1970 (7 stations)

# Today

---

- Hydro supplies 62% of nations energy needs
- Long distance DC cables connect the islands
- Capacity of over 5GW
- Many retrofits of existing plants

Arapuni  
Dam

# Major Notable Rivers and Schemes

---

- Waikato river: Cascade setup
- Tongariro power scheme: Water collected from tributaries and mountains feeds three stations
- Lakes Pukaki and Tekapo: System of dams and power plants

# The Science: (Why can't we build infinite dams?)

---

# Topography

---

- Elevation change
- Narrowing
- Favorable materials (type of soil, rock, etc)
- Open flood plains wouldn't work

# Energy

---

- Finite amount of energy in the river
- Blocked river flow
- Infinite number of dams is impossible
- Some river have more usable energy than others

## Kinetic & Potential Energy

---

$$KE = \frac{1}{2} m V^2 \quad PE = mgh$$

Credit:[https://www.google.com/url?sa=i&url=https%3A%2F%2Fwww.youtube.com%2Fwatch%3Fv%3DDyaVgHGssos&psig=A0vVaw37ePq-w0AqYenclDYpe2FF&ust=1681493479731000&source=images&cd=vfe&ved=0CB1QjhxqFwoTCJDcQL6xp\\_4CFQAAAAAdAAAAABAE](https://www.google.com/url?sa=i&url=https%3A%2F%2Fwww.youtube.com%2Fwatch%3Fv%3DDyaVgHGssos&psig=A0vVaw37ePq-w0AqYenclDYpe2FF&ust=1681493479731000&source=images&cd=vfe&ved=0CB1QjhxqFwoTCJDcQL6xp_4CFQAAAAAdAAAAABAE)

# Turbine Size

---

## New Zealand:

- Limited space on rivers (width)
- Construction limitations
- Road infrastructure for machinery
- Smaller plants

## US:

- More space
- Larger plants = less needed

# Environmental

# Flooding

---

US:

- wetlands
- towns (voluntarily)
- more development along rivers

New Zealand:

- planned dams will raise lakes
- protested
- more of an effect on natural lands

# Fish

---

- Dams can destroy habitat
- Cause stagnation and harm oxygenation
- Cause algal blooms (from excess nitrogen and phosphorus)
- Limit migration

US:

- Salmon migrations
- Less food from natural flooding

New Zealand:

- Less variety of fish after the dam
- Large effect on eels
- Less of a problem for salmon (farmed commercially)

# Concrete

---

- Example: Hoover dam uses 4,360,000 cubic yards of concrete
- 1 cubic yard is 3900 pounds
- 1 cubic yard creates 400 pounds of co2
- New Zealand has access to limestone
- Similar costs

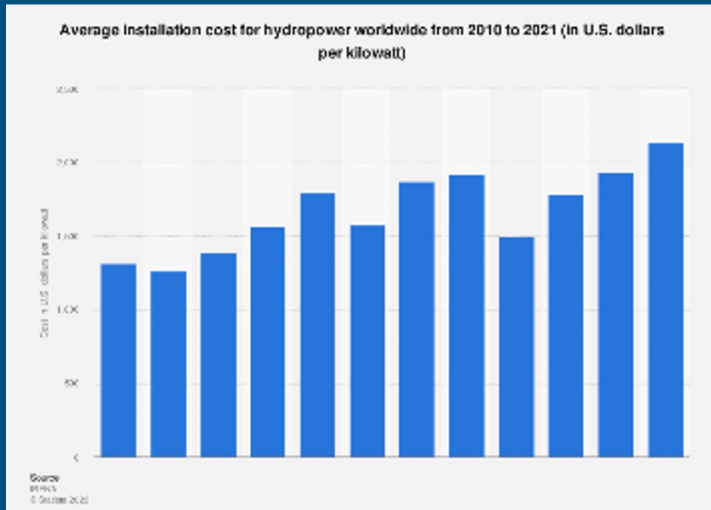

# Economics

# Capital Costs (US)

- A large dam can cost Billions of Dollars today (\$1000-\$6000 per KW)
- Hoover dam cost was around \$750 Million (inflation adjusted)
- Construction time up to a decade

# LCOE (US)

**Table 4b. Value-cost ratio (unweighted) for new resources entering service in 2027**

Plant type	Average unweighted LCOE <sup>a</sup> or LCOS <sup>a</sup> with tax credits (2021 dollars per megawatthour)	Average unweighted LACE <sup>a</sup> (2021 dollars per megawatthour)	Average value-cost ratio <sup>b</sup>	Minimum <sup>c</sup>	Maximum <sup>c</sup>
<b>Dispatchable technologies</b>					
Ultra-supercritical coal	\$82.61	\$38.69	0.47	0.40	
Combined cycle	\$39.94	\$39.54	0.99	0.91	
Advanced nuclear	\$81.71	\$38.42	0.47	0.41	
Geothermal	\$37.62	\$45.11	1.20	1.08	
Biomass	\$90.17	\$39.84	0.45	0.28	
<b>Resource-constrained technologies</b>					
Wind, onshore	\$40.23	\$34.54	0.88	0.60	
Wind, offshore	\$105.38	\$36.00	0.34	0.27	
Solar, standalone <sup>d</sup>	\$33.83	\$32.85	0.98	0.72	
Solar, hybrid <sup>d,e</sup>	\$49.03	\$45.53	0.93	0.64	
Hydroelectric <sup>e</sup>	\$64.27	\$37.87	0.60	0.45	
<b>Capacity resource technologies</b>					
Combustion turbine	\$117.86	\$101.74	0.86	0.61	
Battery storage	\$128.55	\$101.01	0.79	0.52	

# New Zealand Levelized Costs per MWh

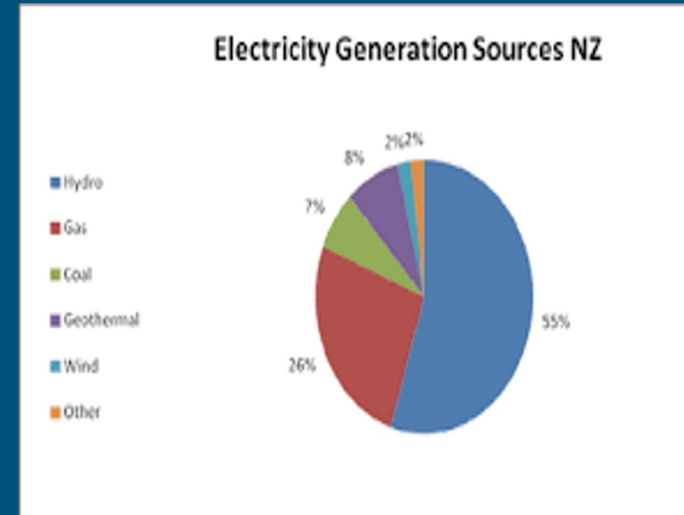

Geothermal: \$70 (limited resource/best sites are used first)

Gas:\$85 (with carbon costs)

Coal: \$110 (with carbon costs)

Wind:\$80 (limited resource/best sites are used first)

Hydro:\$75-\$100 (long construction times)

# Conclusion

---

- Hydro power has become expensive
- Can cause flooding and harm fish
- Limited resource potential (location and available energy)
- New Zealand has access to fewer alternatives
