

# What do X-ray powder diffraction patterns look like?

# What do X-ray powder diffraction patterns look like?

$$\lambda = 2d_{hkl} \sin \theta_{hkl}$$

So what does x-ray diffraction pattern look like?

Ideally,  $\lambda$  is fixed at a single value

Measure positions of reflections as  $\theta$  is changed

What values of  $d_{hkl}$  are possible?

# What do X-ray powder diffraction patterns look like?

Each peak in pattern is a reflection from a different set of planes

By determining  $2\theta$  for a peak, can use Bragg's law to get  $d$  for that set of planes

## Powder patterns - what information available in pattern?

1. peak positions
2. peak intensities
3. peak shape
4. background structure

## Powder patterns - what information available in pattern?

1. peak positions - give unit cell shape, size, and symmetry

Simple example - P cubic:

Naming each peak with Miller indices is called "indexing the pattern"

# Indexing

Message: indexing cubic patterns is usually pretty easy especially, if done visually

Why:

usually, relatively few reflections  
reflections evenly spaced  
only one lattice parameter to guess

# Indexing

In cubic:

$$d_{hkl} = a/(h^2 + k^2 + l^2)^{1/2} = a/s^{1/2}$$

$$a = s^{1/2} d_{hkl}$$

$s$  is an integer ..... 1, 2, 3, 4....

Since  $\lambda = 2d_{hkl} \sin \theta_{hkl}$ , smallest  $\theta$  means largest  $d_{hkl}$

Since  $a = s^{1/2} d_{hkl}$ , largest  $d_{hkl}$  means smallest  $s$  value

Thus, lowest  $2\theta$  reflections in pattern are those with small  $s$  values

# Indexing

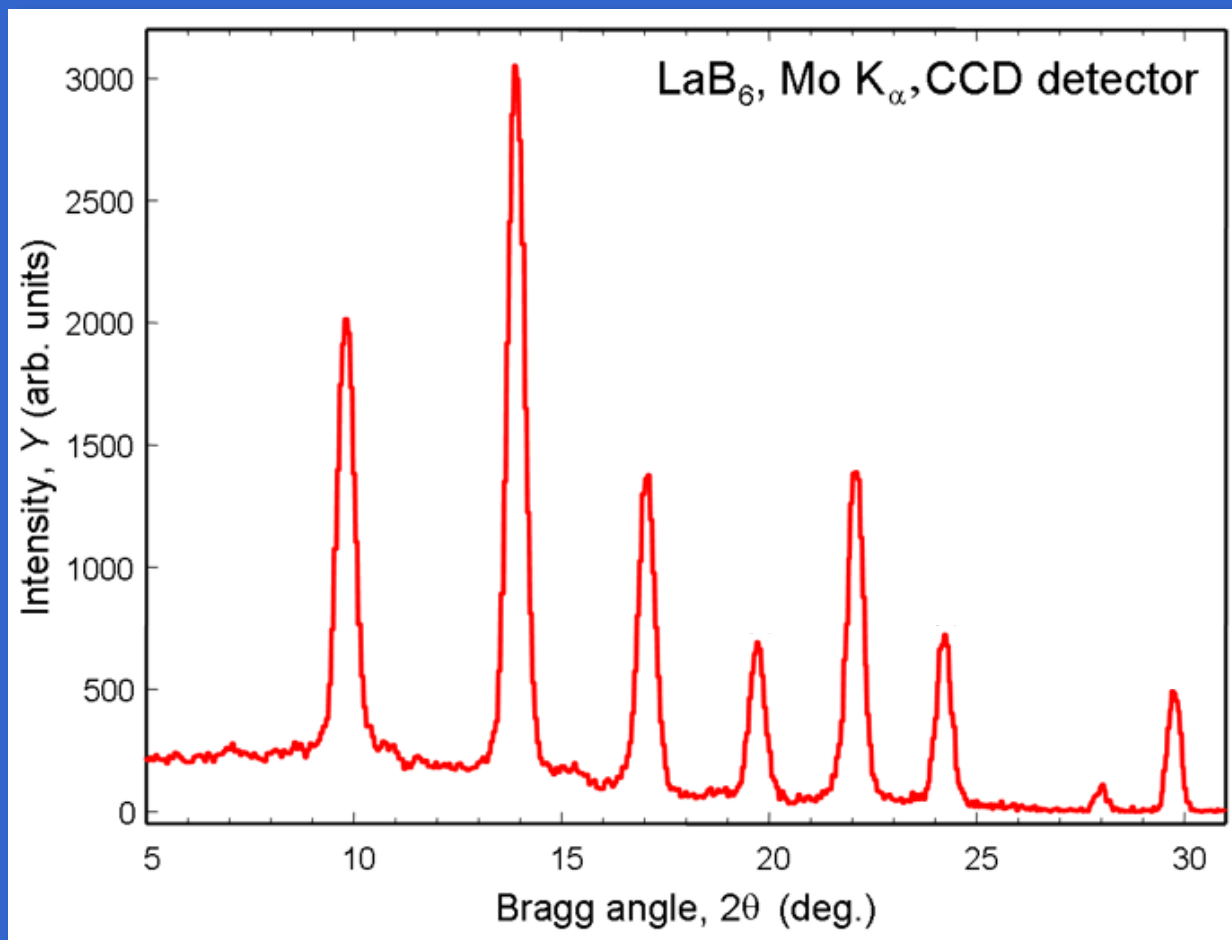

Fill in the (hkl)s for these s values

$h^2 + k^2 + l^2$	P

# Indexing

Slight complication: 3 different Bravais lattices in cubic

P cubic    All planes, reflections possible

I cubic    (hkl) present only if  $h + k + l = \text{even}$

F cubic    (hkl) present only if h,k,l all even or all odd

Translational symmetry gives missing planes -  
thus missing reflections

These are "extinction rules"

# Indexing

Fill in the (hkl)s for these I cubic ( $h + k + l = \text{even}$ )  
& F cubic ( $h, k, l$  all even or all odd)

$h^2 + k^2 + l^2$	P	I	F
1	(100)		
2	(110)

10	(310)		
11	(311)		
12	(222)		

# Indexing

# Indexing

## Index

# Indexing

How to know indexing is correct?

Correct indices give consistent set of lattice parameters

Example for cubic:

$d(\text{\AA})$	<del>(hkl)</del>	<del><math>a(\text{\AA})</math></del>	(hkl)	$a(\text{\AA})$
3.157			(111)	5.468
1.931			(220)	5.462
1.647			(311)	5.462
1.366			(400)	5.464

# Indexing

Other types of translational symmetry also give missing planes

glide planes and screw axes

Ex: F  $4_1/d$   $\bar{3}$   $2/m$

 (0kl) present if  $k + l = 4n$

(hhl) present if  $h + l = \text{even}$

(hkl) if  $h + k + l = \text{odd or } 4n$   
(for some structures w/ this space group)

# Indexing

What if it's not cubic?

Manual indexing methods usually very tedious - use computer indexing programs such as "Ito", "Treor", "Crysfire", "Dicvol", others

Computer indexing frequently not easy - sometimes have to use several, or all, indexing programs to figure out right answer

## Why index?

It can be fun! Like solving a puzzle

Indices needed to calculate lattice parameters  
need (hkl) and  $d_{hkl}$  for all reflections

use all reflections to get high precision

cubic:  $d_{hkl}^2 = a^2 / (h^2 + k^2 + l^2)$

tetragonal:  $1/d_{hkl}^2 = (h^2 + k^2)/a^2 + l^2/c^2$

hexagonal:  $1/d_{hkl}^2 = (4/3)(h^2 + k^2 + hk)/a^2 + l^2/c^2$

orthorhombic:  $1/d_{hkl}^2 = h^2/a^2 + k^2/b^2 + l^2/c^2$

etcetera

# Indexing

ATCF!!!

But.....小心

Looks cubic

But it is not!  
(C orthorhombic)

# Powder patterns - what information available in pattern?

1. peak positions
2. peak intensities - how much?
3. peak shape
4. background structure

Relatively recent  
increase in use of X-  
ray diffraction for  
quantitative analysis

## Powder patterns - what information available in pattern?

1. peak positions
2. peak intensities - how much?
3. peak shape
4. background structure

Quantitative analysis

Example: 2-phase mixtures of  $\text{CaF}_2$  &  $\text{ZnO}$

# Quantitative Analysis

Use measured intensities .... but not simple

Main equation for quantitative analysis

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

# Quantitative Analysis

Use measured intensities ..... but not simple

Main equation for quantitative analysis

$I_{ia}$  = intensity of  
reflection  $i$  of  
phase  $a$

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

# Quantitative Analysis

Use measured intensities ..... but not simple

Main equation for quantitative analysis

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

$\rho_a$  is density of  
phase a

# Quantitative Analysis

Use measured intensities ..... but not simple

Main equation for quantitative analysis

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

$K_{ia}$  contains structure factor, multiplicity, Lorentz-polarization factor, temperature factor + scale factor for reflection  $i$  of phase  $a$

# Quantitative Analysis

Use measured intensities ..... but not simple

Main equation for quantitative analysis

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

$X_a$  = wt fraction of  
phase a (want this!!)

# Quantitative Analysis

Use measured intensities ..... but not simple

Main equation for quantitative analysis

measure this!!

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

$X_a$  = wt fraction of phase a (want this!!)

But what do we do with  $\mu$ ?

# Quantitative Analysis

Use measured intensities .... but not simple

Main equation for quantitative analysis

Measure this!!

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

$X_a$  = wt fraction of phase a (Want this!!)

But what do we do with  $\mu$ ?  $\mu$  is mass attenuation coefficient for mixture .... unknown, unless we know

# Quantitative Analysis

Use measured intensities .... but not simple

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

If sample contains > one phase, then  $\mu$  unknown if wt fractions unknown

$$\mu_{\text{mix}} = X_1 \mu_{\text{phase 1}} + X_2 \mu_{\text{phase 2}} + X_3 \mu_{\text{phase 3}} + \dots$$

$\mu$  for each phase may be calculated from the chemical composition of each phase

$$\mu_{\text{compd}} = X_1 \mu_1 + X_2 \mu_2 + X_3 \mu_3 + \dots$$

# Quantitative Analysis

Use measured intensities .... but not simple

Main equation for quantitative analysis

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

would also be nice not to calc  $K_{ia}$  or get  $\rho_a$

# Quantitative Analysis

Use measured intensities .... but not simple

Simple example: rutile/anatase polymorphs  
since polymorphs have same composition:

$$\mu_{\text{mix}} = \mu_{\text{rutile}} = \mu_{\text{anatase}}$$

Suppose we measure  $I_{\text{irutile}}^{\circ}$  of pure rutile  
can eliminate  $\mu_{\text{mix}}$  (& other stuff)

$$\frac{I_{\text{irutile}} = \frac{\cancel{K_{\text{irutile}}} X_{\text{rutile}}}{\cancel{\rho_{\text{rutile}}} \cancel{\mu}}}{I_{\text{irutile}}^{\circ} = \frac{\cancel{K_{\text{irutile}}}}{\cancel{\rho_{\text{rutile}}} \cancel{\mu_{\text{rutile}}}}} = X_{\text{rutile}}$$

# Quantitative Analysis

Use measured intensities .... but not simple

$$I_{ia} = \frac{K_{ia} X_a}{\rho_a \mu}$$

For mixtures that are not polymorphs, many single & multiple peak procedures have been developed that use known amounts of

internal standards - mixed with unknown

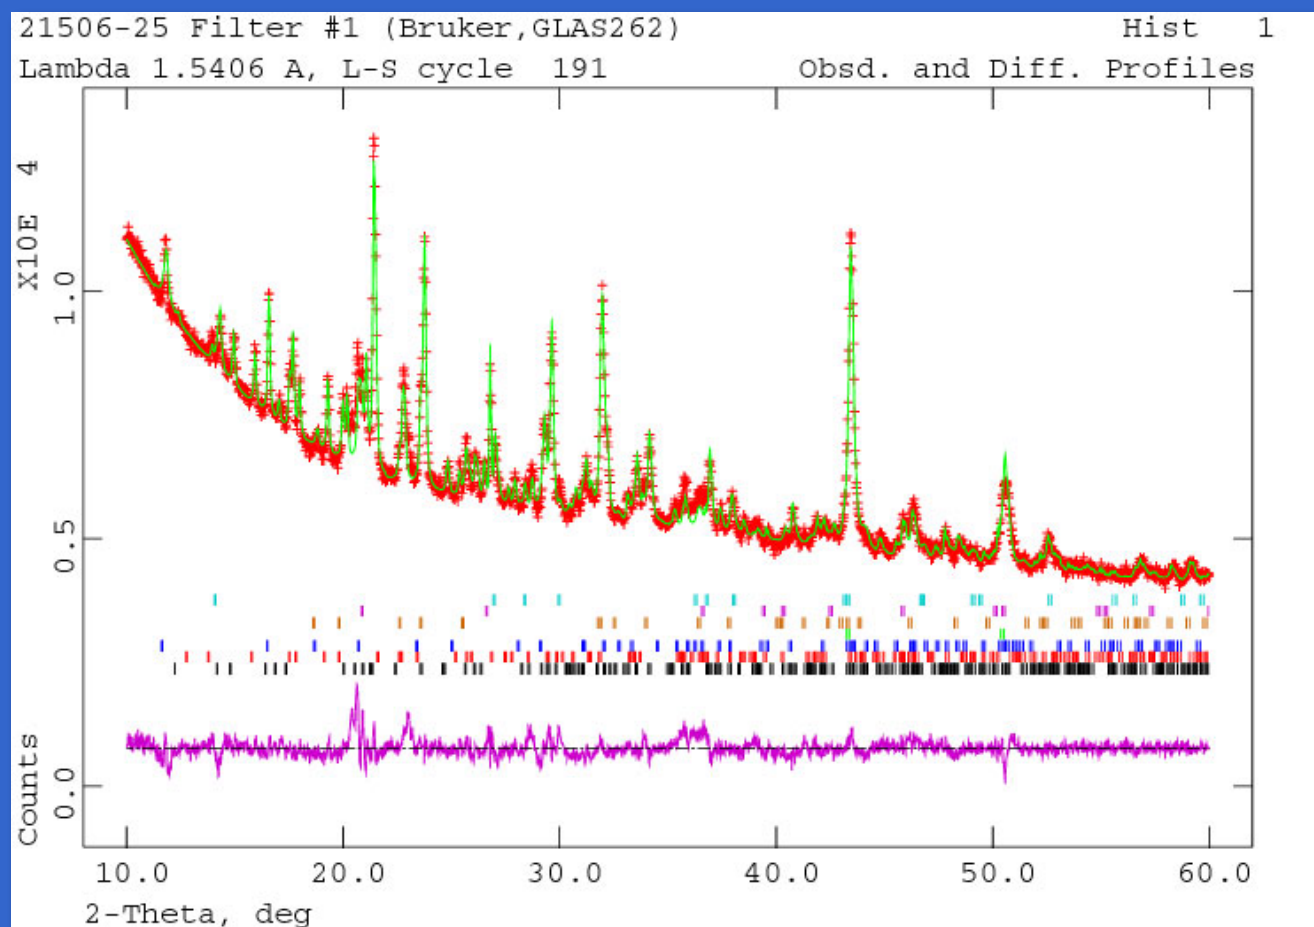

external standards - run separate x-ray pattern  
of standard material

Most analysis techniques tell only what elements are present & how much. X-ray diffraction tells how much of what PHASES are present

# Quantitative Analysis

Recently, whole pattern analysis methods for quantitative analysis have become popular. Example: Rietveld analysis

Rietveld analysis of fuel deposit

# Quantitative Analysis

## Rietveld analysis of fuel deposit
